Aggiornamento tavole grafiche di rilievo

INTRODUZIONE e PREMESSE

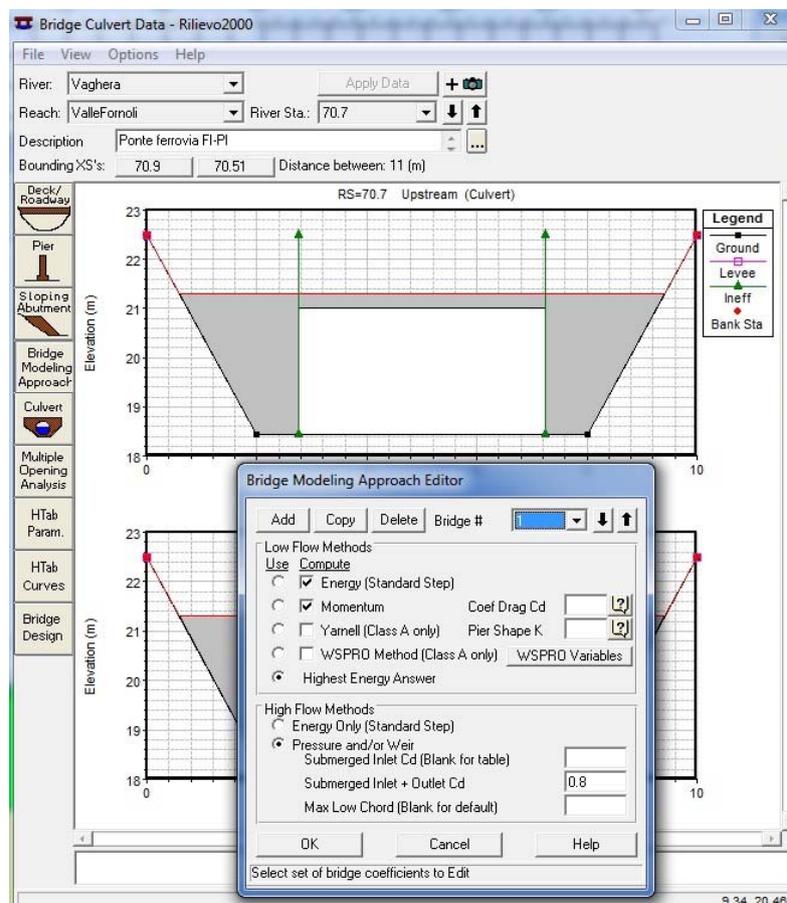

La presente relazione di calcolo idraulico, aggiorna la relazione emessa in data Aprile 2017, All. B3-IV, in conseguenza alla conferenza di servizi tenuta nella sede del Comune di Montopoli in Val D'Arno del 11.04.2017; di seguito vengono illustrate le modifiche introdotte sia al modello idrologico che a quello idraulico ed infine vengono riportati i risultati delle elaborazioni di calcolo:

MODIFICHE AL MODELLO IDROLOGICO

- Sono state eliminate le aree di laminazione Santa Marta 1 e 2 quantunque il modello idrologico precedente risultasse a nostro avviso corretto e rispondente alla realtà dei luoghi per i tempi di ritorno presi in considerazione, ma a favore di sicurezza si è ritenuto di eseguire la modellazione astraendo dalla presenza di queste due aree;
- Sono stati aggiornati i valori dei CN;
- Il valore del coefficiente la è stato ridotto a 0,20.

MODIFICHE AL MODELLO IDRAULICO

- Sono state aggiornate le tavole di rilievo con le sezioni principali di rilievo A, B, C, D, E, F, G, H, I ed L (vedasi grafici allegati);
- E' stata corretta la sezione 67 così come la pendenza dell'alveo nella condizione di valle ed i parametri al ponte ferroviario "momentum" e "pressure and/or weir";

- Nel tratto principale dell'alveo, tra il sottopasso su Via Fontanelle e la Ferrovia FI-PI sono state interpolate ulteriori sezioni con interdistanza non superiore a 30-35 m;
- La quota del rilevato ferroviario è riscontabile dalla tav. 8 e risulta pari a 21,30 m slm e quindi superiore di 30 cm alla quota della CTR di 21,00 m slm, pertanto nella condizione di valle "Arno High" è stata considerata il livello dell'Arno pari a 20,70 m slm anziché 21,00 m slm come risulta dagli atti di verifica del Fiume Arno di ADB per TR=30;
- Il valore di scabrezza dei sottopassi è stato reso omogeneo con quello utilizzato nel modello idrologico.

CONCLUSIONI

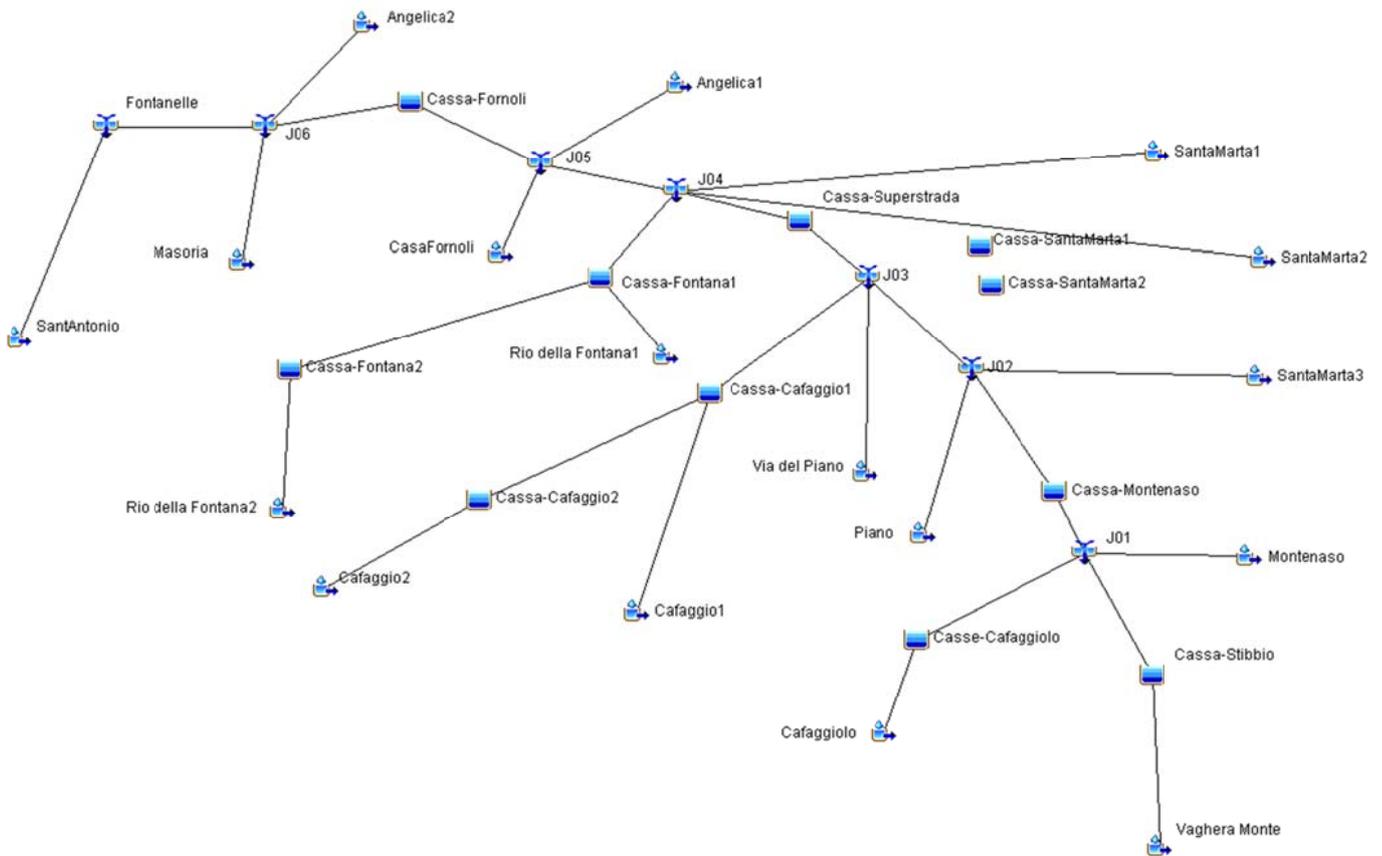

Si riportano di seguito gli adeguamenti delle elaborazioni già effettuate con la precedente relazione verificando ancora una volta la generale sufficienza della porzione di corso d'acqua (zona industriale Fontanelle) a contenere le portate aggiornate con il nuovo modello idrologico all'interno dell'alveo.

Riepilogo simulazioni per i tempi di pioggia 30, 60, 90, 120, 150 e 180 min, con il software HMS pervenendo alla determinazione degli idrogrammi di piena in uscita da ciascun sottobacino con particolare riferimento agli idrogrammi di portata in uscita dal sottobacino di Via Fornoli (nodo J06) e dal sottobacino Fontanelle che tiene conto dell'ingresso nel Vaghera del bacino S. Antonio dopo il sottopasso su Via Fontanelle (utilizzati nella modellazione a moto permanente HEC-RAS sul tratto terminale del Torrente che attraversa la zona industriale di Fontanelle).

Si riportano di seguito le tabelle riepilogative dei risultati più significativi per le seguenti condizioni:

1. uscita da Via Fornoli (J06), ingresso sez 87 HECRAS, Tr=30 anni, Tp=30, 60, 90, 120, 150 e 180 min,
2. uscita da Fontanelle, ingresso sez 80 HECRAS, Tr=30 anni, Tp=30, 60, 90, 120, 150 e 180 min,

utilizzati nella successiva modellazione idraulica:
